                                New polypeptide, that is a functional equivalent of ERCoA3 (Estrogen Receptor Coregulator 3), is useful in inhibiting or reducing tamoxifen or estrogen-induced proliferation of cancer cells and in treating
                                                                                                                                                                                                                                                                                                                                                                                      GGGCTCTGGACTGGGCTAGGGGAAGGCAGAGGGGGGGAATTGGGCCCGAGGGCCAGGCC
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        382
                                                                                                           The invention relates to a ERCOA3 (Estrogen Receptor Coregulator 3) protein and encoding polynucleotides. ERCOA3 can be used to inhibit or reduce tamoxifen or estrogen induced proliferation of cancer cells, by reduced activity of ERCOA3, and for detecting cancer cells that are tamoxifen resistant, or to treat osteoporosis, by increasing levels of ERCOA3 in cells. The encoding polynucleotide can be used to inhibit translation of a mRNA encoding ERCOA3. ERCOA3 acts as a coregulator protein and can bind to the estrogen receptor to activate a molecular or cellular response in the cell. The present sequence represents the human
                                                                                                                                                                                                                                                                                                                                                                           20

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II) The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed consists. (I) is useful in gene therapy techniques to restore normal cation of (II) or to treat disease states involving in medical maging olypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of supplement. (II) and its binding partners are useful in medical imaging of supplement. (II) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynuclectide sequences have applications in the printing of mino acid sequences. Asketly Thanks, traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. Asketly Thanks, traits to assess biodiversity and to produce other types of data and products dependent on DNA and coning sequences. Asketly represent novel human diagnostic coding sequences of the invention. Note: The sequence data for this parent did not appear in the printed specification, but was obtained in the format diagnostic and the printed specification, but was obtained in the format diagnostic and the printed specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             403 rocorgecaatatorgeagagagaggtreaaggaccegecregorigiagagacatrgac 344

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       106953
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a novel polynucleotide encoding a guanosine triphosphate-binding protein coupled receptor (GPCR). A polynucleotide of the invention may have a use in gene therapy. The polynucleotide and polypeptide are useful for preparing a composition for treating a patient in need of increased or suppressed activity or expression of the guanosine triphosphate-binding protein coupled receptor. The polynucleotide sequences shown in ADC85548-ADC87616 encode GPCR's of the

The invention relates to novel proteins involved in the biosynthesis of polyketide dorrigocin (DORR) or lactimidomycin (LACT) biosynthesis by microorganisms. Sequences of the invention allow direct manipulation of dorrigocin, lactimidomycin and related chemical structures via chemical engineering of the enzymes involved in the biosynthesis of dorrigocin and lactimidomycin. They are useful for introducing chemical handles into normally inert positions that permit subsequence chemical modifications and facilitate the development of polyketides. The genes and proteins of around a polyketide lead candidate to fine-tune the compound for optimal properties. They are useful for generating antibodies specific for the polyketide biosynthesis. The present sequence is Streptomyces platensis subspecies rosaccus DORR ORF6 DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel isolated or purified polypeptide involved in biosynthesis of polyketide dorrigocin or polyketide lactimidomycin, useful for preparing dorrigocin or lactimidomycin.
                                                                                                                                                                                                                                                                                                                                                    Polyketide biosynthesis; dorrigocin; DORR; lactimidomycin; LACT; gene;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 24081 BP; 3269 A; 9645 C; 8186 G; 2981 T; 0 U; 0 Other;
                                                                                                                                                                                                                                                                                               Streptomyces platensis subspecies rosaceus dorrigocin ORF6 DNA.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                30183 cédercareagregregregregracregégecaaegreeceaceaceaecreerecregége 30242
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to novel proteins involved in the biosynthesis of polyketide dorrigocin (DORR) or lactimidomycin (LACT) biosynthesis by microorganisms. Sequences of the invention allow direct manipulation of dorrigocin, lactimidomycin and related chemical structures via chemical engineering of the enzymes involved in the biosynthesis of dorrigocin and lactimidomycin. They are useful for introducing chemical handles into normally inert positions that permit subsequence chemical modifications and facilitate the development of polyketides. The genes and proteins of the invention can also be used to generate a focused library of analogues around a polyketide lead candidate to fine-tune the compound for optimal properties. They are useful for generating antibodies specific for the polyketide biosynthesis. The present sequence is Streptomyces platensis subspecies rosaceus DORR DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                61
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             28 uGlyGlnGluGlyGlyIleGlyProGluGlyGlnAlaSerProThrProAspCysAlaSe 48

AAH52093 to AAH52303 encode the human secreted proteins given in AAG81242 to AAG81455. The secreted proteins can be used for directing the secretion of proteins of interest from a host cell including bacteria, fungal cells, and cultured higher eukaryotic cells. The present invention also describes fusion proteins, where a secreted protein of the invention is operably linked via a peptide bond or peptide linker to a second protein selected from the group consisting of maltose binding protein, an immunoglobulin constant region, a polyhistidine tag and a peptide given

                                                                                                                                                                                                                                                                                                                                                                                          The present sequence is the coding sequence for humanised mutant fluorescent protein, Mutl, from non-bioluminescent Anemonia sulcata. The fluorescent protein has applications in fluorescent labelling, as fluorescent markers for gene expression action localisation studies, and in fluorescence resonance energy transfer (FRET) reactions. The coding sequence may be used as a source or primers and probes for identifying related proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 592 recedencercenceaagecesecarcarcasesesaseseseseseseseseseses 533

invention. The antibody may be used for detecting the PRO proteins of the invention. The antibody may be used for detecting the PRO proteins of the invention and may be used to modify their activity. Polynucleotides may be used as hybridisation probes for a cDNA library to isolate the full-length PRO cDNA or to isolate other cDNA, to construct hybridisation probes for mapping the gene which encodes that PRO and for genetic analysis of individuals with genetic disorders, in assays to identify other proteins or molecules involved in binding reaction, to generate transgenic animals or knock-out animals which in turn are useful in the development and screening of therapeutically useful reagents, for chromosome identification, and tissue typing. The PRO polypeptides are useful in gene therapy, and as molecular weight markers for protein electrophoresis purposes. The sequences may also be used to detect overexpression on PRO polypeptides in cancerous tumours and for screening for differentially expressed genes using microarray technology. The present sequence represents a cDNA encoding a human PRO protein of the

The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polymucleotides encoding them. The invention also relates to an antibody which specifically binds to a PRO polypeptide, a method for stimulating the release of tumour necrosis factor-alpha (TNF-alpha) from human blood, a method for stimulating the proliferation or differentiation of chondrocyte cells and a method for detecting the presence of a tumour in a mammal (e.g. adrenal, lung, clon, breast, prostate, rectal, cervical and liver tumours). The polymucleotides are useful in molecular biology, including uses as pubridisation probes, in chromosome and gene mapping, in generating antisense RNA and DNA and in gene therapy. The polymucleotides may also antisense RNA and DNA and in gene therapy. The polymucleotides and in generating either transgenic animals or knock-out animals which are useful in the development and screening of therapeutically useful caseful in the development and screening of therapeutically useful andicament for treating a condition responsive to the polypeptides or antibodies, such as tumours, for stimulating and inhibiting proliferation of the formation and for treating sports-related joint problems, articular cartilage defects, osteoarthribis and rheumatoid arthritis. This sequence represents a human PRO polymucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel isolated PRO1313, PRO20080 or PRO21383 polypeptide useful for stimulating proliferation of human microvascular endothelial cells, and PRO6018 polypeptide useful for stimulating proliferation of chondrocyte
                                                                                                                                                                                                                                                                                                                              7

The invention relates to an isolated secreted/transmembrane (PRO) polypeptide, having at least 80% sequence identity to a sequence selected from any one of the 57 amino acid sequences given in specification, or to a sequence encoded by a nucleic acid sequences given in specification, or a sequence having at least 80% identity to PRO in specification, or a sequence having at least 80% identity to PRO with or without its associated signal peptide, an extracellular domain of PRO with or without its associated signal peptide. Also included are vectors, transformed host cells, anti-PRO antibodies, the nucleic acids encoding PRO, PRO fusion proteins, inducing endothelial cell tube formation (by administering PRO281, PRO280), PRO180, PRO4499, PRO6308, PRO65000, PRO18055, PRO421207, PRO250933 or PRO34274 polypeptide or its agonist) and

```

an oligonucleotide probe derived from any one of the above nucleotide sequences. PRO6018 polypeptide is useful for stimulating the proliferation of differentiation of condrocyte cells. PRO1313, PRO20080 and PRO6018 polypeptides are useful for stimulating the proliferation of human microvascular endothelial cells. PRO6071, PRO4487 and PRO6006 polypeptides are useful for inhibiting the proliferation of human microvascular endothelial cells. PRO 6011, PRO487 and PRO6006 cells of the presence of tumour in a mammal, including tumours of lung, detecting the presence of tumour in a mammal, including tumours of lung, PRO189, PRO499, PRO6508, PRO6000, PRO10275, PRO21207, PRO2033 and PRO6189, PRO6409, PRO6000, PRO10275, PRO21207, PRO2033 and PRO3474 polypeptides are useful for inducing endothelial cell tube formation. PRO or the antibody are useful in the preparation of an medicament for treating a condition responsive to PRO polypeptide. The oligonucleotide probes are useful for isolating genomic and cDNA associated gene, and as antisense probes. PRO nucleic acid is useful as hybridisation probe, in chromosome and gene mapping, in the generation of RPO nucleic acid are useful as therapeutic agents, e.g. vaccines. The present sequence encodes a PRO protein. 197 312 GAGGCACCGTCAAACTGCAGTTCGACATGATGCGCGCCTGCAACCTGGTGGCCACGAGGCCG 371 372 cecrcaccecaeccaecricacerricirecrasserresideresidensecres 431 432 CCGACGCCCCGTGCTGGGAGGAGGCCATGGCCGCTGCATTCCAACTGGCGAGTTTTGTCC 491 198 TGGTGGACAGGACCGGGGGAGGGCCGA-----GCCCTGGGGGCCAGAGCCGGCCAGGTGG 251 37 44 52 53 ------SerAlaSerArgTrpProTrpSerAla-GlyLeuThrValAr 66 gAspArgProGlnLeu------GlyGluLeuCysMe 76 CysGlyArgProArgArgValSerAlaGlyCysGlyPheAlaAspAlaHisTrpThrGly -----GlyGlnAlaSerProThrPro ---TrpProArg---LeurrpihrGlyLeuGlyGluGlyGluGlyGlyGlyIleGlyProGlu-----ss; gene; human; PRO; secreted protein; transmembrane protein; endothelial cell tube formation; chondrocyte cell differentiation; Human cDNA encoding secreted/transmembrane polypeptide PRO21434. The invention relates to an isolated secreted/transmembrane (PRO)

polypeptide, having at least 80% sequence identity to a sequence selected
from any one of the 57 anino acid sequence given in specification, or to
a sequence encoded by a nucleic acid molectule selected from any one of
the nucleic acids deposited under any of the ATCC accession numbers given
in specification, or a sequence having at least 80% identity to PRO
lacking its associated signal peptide. Also included are vectors,
transformed host cells, anti-PRO antibodies, the nucleic acids encoding
PRO, PRO fission proceins, inducing endothelial cell tube formation (by
administering PRO281, PRO1860, PRO189, PRO4499, PRO6800,
PRO1075, PRO21207, PRO2033 or PRO34274 polypeptide or its agonist) and
an oligonucleotide probe derived from any one of the above nucleotide
sequences. PRO6018 polypeptide is useful for stimulating the
proliferation or differentiation of conducove cells. PRO1313, PRO220080
and PRO2133 polypeptides are useful for stimulating the proliferation of
human microvascular endothelial cells. PRO6071, PRO4487 and PRO6006
colon, breast, prosence of tumour in a mammal, including tumours of lung,
acceptage the presence of tumour in a mammal, including tumours of lung,
colon, breast, prostate, rectal, kidhey and liver. PRO281, PRO1806,
PRO18274 polypeptides are useful for inhibiting encounted are useful for sequences.

CC formation. PRO or the antibody are useful in the preparation of a
medicament for treating a condition responsive to PRO 900, peptides, and
associated gene, and as antisense probes. PRO nucleotide sequences, for measuring or detecting the expression of New secreted and transmembrane PRO polypeptides, e.g. PRO20080 or PRO21383 useful for stimulating the proliferation or differentiation of chondrocyte cells and detecting the presence of a tumor in a mammal. Grimaldi JC; Wood WI, Zhang Z; nicrovascular endothelial cell; tumour; lung tumour; colon tumour; PRO nucleic acid are useful as therapeutic agents, e.g. vaccines. breast tumour; prostate tumour; rectal tumour; kidney tumour; Sequence 943 BP; 152 A; 306 C; 299 G; 186 T; 0 U; 0 Other; Goddard A, Watanabe CK, present sequence encodes a PRO protein. Eaton DL, Filvaroff E, Smith V, Stephan JP, liver tumour; cytostatic; vaccine. Claim 2; Fig 111; 307pp; English. .8-SEP-2002; 2002US-00246210. 04-APR-2001; 2001US-0282199P. 29-AUG-2001; 2001WO-US027099. 18-JUL-2002; 2002US-00197942. (GETH) GENENTECH INC. WPI; 2003-743814/70. P-PSDB; ADA43577. US2003073196-A1. Homo sapiens. 17-APR-2003. Gurney AL, Fong S; Baker KP,

The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polynucleotides encoding them. The invention also relates to an antibody which specifically binds to a PRO polypeptide, a method for stimulating the release of tumour necrosis factor-alpha (TNF-alpha) from human blood, a method for stimulating the projection or differentiation of chondrocyte cells and a method for detecting the presence of a tumour in a mammal (e.g. lung, colon, breast, prostate, rectal, kidney and liver tumoure). The polymucleotides are useful in molecular biology, including uses as hybridisation probes, in chromosome and gene mapping, in generating antiense RNA and DNA and ingene therapy. The polymucleotides may also be used in preparing PRO polypeptides by recombinant techniques and in generating either rangemic animals or knock-out animals which are useful in the development and screening of therapeutically useful reagents. The PRO polypeptides or antibodies are used in preparing a medicament for treating a condition responsive to the polypeptides or antibodies, such as tumours, for stimulating and inhibiting proliferation of human microvascular endothelial cells and for inducing endochelial cell tube increase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          311

The invention relates to an isolated secreted/transmembrane (PRO)

polypeptide, having at least 80% sequences identify to a sequence selected
from any one of the 57 amino acid sequences given in specification, or to
a sequence encoded by a nucleic acid molecule selected from any one of
the nucleic acids deposited under any of the ATCC accession numbers given
in specification, or a sequence having at least 80% identity to PRO
continued its associated signal peptide. Also included are vectors,
transformed host cells, anti-PRO antibodies, the nucleic acids encoding
transformed host cells, anti-PRO antibodies, the nucleic acids encoding
transformed host cells, anti-PRO antibodies, the nucleic acids encoding
transformed host cells, pRO189, PRO499, PRO6000,
TRO, PRO fusion proteins, inducing endothelial cell tube formation (by
administering PRO2107, PRO20933 or PRO34274 polypeptide or its agonist) and
con oligonuclectide probe derived from any one of the above nucleotide
sequences. PRO6018 polypeptide is useful for stimulating the proliferation of
sequences. PRO6018 polypeptide is useful for stimulating the proliferation of
an oligonucleotide probes are useful for stimulating the proliferation of
prolypeptides are useful for inhibiting the proliferation of human
microvascular endothelial cells. PRO600, PRO180, PRO4499
TRO34274 polypeptides are useful for inhibiting the proliferation of human
microvascular endothelial cells. PRO600, PRO180, PRO4499, PRO600, PRO180, PRO600, PRO180, PRO4499, PRO600, PRO180, PRO600, PRO180, PRO4499, PRO600, PRO180, PRO600, PRO600, PRO180, PRO600, 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel isolated PRO polypeptides e.g. PRO281 and PRO1560, useful in the preparation of a medicament for treating a condition responsive to PRO polypeptide, and as therapeutic agents e.g. vaccines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Grimaldi JC;

The invention relates to an isolated secreted/transmembrane (PRO)

C polypeptide, having at least 80% sequence identity to a sequence selected
from any one of the 57 amino acid sequences given in specification, or to
a sequence encoded by a nucleic acid molecule selected from any one of
the nucleic acids deposited under any of the ATCC accession numbers given
in specification, or a sequence having at least 80% identity to PRO
c acking its associated signal peptide, an extracellular domain of PRO
c with or without its associated signal peptide, Also included are vectors,
transformed host cells, anti-PRO antibodies, the nucleic acids encoding
the or without its pro2019. PRO1509, PRO6109, PRO6100,
CC with or without its pro2019. PRO1509, PRO6100, PRO 100, PRO 100, PRO 100, PRO 100, PRO1009, PRO6100, PRO1019, PRO6400, PRO6100, PRO61000, PRO61000, PRO61000, PRO61000, PRO61000, PRO61000, PRO61000, PRO61000, PRO61000, PRO61
                                                                                                         New isolated nucleic acid encoding a PRO polypeptide, e.g. PRO20080 or PRO21383, useful in molecular biology, chromosome and gene mapping, in generating antisense RNA and DNA, and in gene therapy.
                                                                                                                                                                                                                            Claim 2; Fig 111; 352pp; English,

The invention relates to isolated human PRO polypeptides (secreted and transmembrane polypeptides) and the polynucleotides encoding them. The transmembrane polypeptides and the polynucleotides encoding them. The invention also relates to an antibody which specifically binds to a PRO polypeptide, a method for stimulating the release of tumour necrosis factor-alpha (TNF-alpha) from human blood, a method for stimulating the proliferation of dhondroovy cells and a method for detecting the presence of a tumour in a mammal (e.g. adrenal, lung, colon, breast, prostate, rectal, cervical and liver tumours). The polymucleotides are useful in molecular biology, including uses as hybridisation probes, in chromosome and gene mapping, in generating antisense RNA and DNA and in gene therapy. The polymucleotides may also be used in preparing PRO polypeptides by recombinant techniques and in generating either transgenic animals or knock-out animals which are useful in the development and screening of therapeutically useful reagents. The PRO polypeptides or antibodies are used in preparing a

```
medicament for treating a condition responsive to the polypeptides or antibodies, such as tumours, for stimulating and inhibiting proliferation of human microvascular endothelial cells, for inducing endothelial cell tube formation and for treating various bone and/or cartilage disorders such as sports injuries and arthritis. PRO polypeptides which stimulate the release of proteoglycans from cartilage are useful for treating sports-related joint problems, arthritis. PRO polypeptides are also useful for treating various mammalian haemoglobin-associated disorders such as various thalassaemias and conditions which may benefit from enhanced local lumune system cell infiltration. This sequence represents a human PRO polymucleotide of the invention.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

/lone=10rgan: Lung' Vector: pT773-Pac (Pharmacia) with a
modified polylinker; Site 1: EcoR I; Site 2: Not I;
UI-CF-ENI is a normalized cDNA library containing the
following issue(s): Primary Lung Cystic Fibrosis
Epithelial Cells. The library was constructed according to
Bonaldo, Lennon and Soares, Genome Research, 6:791-86,
1996. First strand CDNA synthesis was primed with an
oligo-dT primer containing a Not I site. Double stranded
cDNA was ligated to an EcoR I adaptor, digested with Not
I, and cloned directionally into pT773-Pac vector. The
oligonucleotide used to prime the synthesis of
first-strand cDNA contains a library tag sequence that is
located between the Not I site and the (dT)18 tail. The
sequence tag for this library is CTGCTCAGGT.

/note="Organ: Lung: Vector: pT773-Pac (Pharmacia) with a modified polylinker; Site 1: Sor I; Site 2: Not I;
Ul-CF-ENI is a normalized cDNA library containing the following tissue(s): Primary Lung Cystic Fibrosis
Ul-CF-ENI is a normalized cDNA library was constructed according to Epithelial Cells. The library was constructed according to Bonaldo, Lennon and Soares, Genome Research, 6:791-806, 1996. First strand cDNA synthesis was primed with an oligo-dT primer containing a Not I site. Double stranded CDNA was ligated to an EcoR I adaptor, digested with Not I, and cloned directionally into pT773-Pac vector. The oligonucleotide used to prime the synthesis of first-strand cDNA contains a library tag sequence that is located between the Not I site and the (dT)18 tail. The sequence tag for this library is CTGCTCAGGT.

Seq primer: M13 FORWARD
with an oligo-dT primer containing a Not I site. Double stranded cDNA was ligated to an EcoR I adaptor, digested with Not I, and cloned directionally into pT7T3-Pac vector. The oligonucleotide used to prime the synthesis of first-strand cDNA contains a library tag sequence that is located between the Not I site and the (dT)18 tail. The sequence tag for this library is GTFAAGCGTC.

AGENCOURT 6553891 NIH_MGC_71 Homo sapiens cDNA clone IMACE:5555626
5', mRNA sequence.
BM806108
adaptor, digested with Not I, and cloned directionally into pT7T3-Pac vector. The oligonucleotide used to prime the synthesis of first-strand cDNA contains a library tag sequence that is located between the Not I site and the (dT)18 tail. The sequence tag for this library is TAG_TISSUE-osteoarthritic cartilage TAG_LIB-UI-H-BUILTAG_ESTGATCACGCT.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           1084
                                                                                                                                                                                                                                                                                                                                                                                  628

Poly(A) + RNA was purified from a 97% pure population of

osteoclasts prepared from the long bones of 10 day old

rabbits. First strand cDNA was synthesized by priming

with an oligo(dr)-Not1 anchor-primer and second strand

cDNA was synthesized by replacement synthesis as described

by Gubler and Hoffman (Gene 25:283, 1983). Following the

addition of Sal1 adappers and Not1 digestion, the cDNA was

cloned between the Sal1 (50) and Not1 (30) sites of the

pSPORT1 (BRL) plasmid vector."

; Patent No. 6551795 : GENERAL INFORMATION:				
; APPLICANT: Marc J.		al.	Rubenfield et al.	
; TITLE OF INVENTION:		NUCLEIC ACID AND AMINO ACID SEQUENCES RELAT	EQUENCES RELATING TO	PSEUDOMON
; FILE REFERENCE: 107196.136	7	R DIAGNOSTICS AN	u ingkargolites	
CURRENT APPLICATION NUMBER: US/09/252,991A	NUMBER: US/09/	252,991A		
; CURRENT FILING DATE: 1999-02-18	1: 1999-02-18			
; PRIOR APPLICATION NUMBER: US 60/074,788	TOMBER: US 60/0	74,788		
; PRIOR FILING DATE: 1998-02-18	1998-02-18			
; PRIOR APPLICATION NUMBER: US 60/094,190	TUMBER: US 60/0	94,190		
; PRIOR FILING DATE: 1998-07-27	1998-07-27			
; NUMBER OF SEQ ID NOS: 33142	S: 33142			
; SEQ ID NO 5885				
; LENGIH: 558				
; TYPE: DNA				
; ORGANISM: Pseudomonas aeruginosa	nas aeruginosa

Patent No. 6607879
GENERAL INFORMATION:
APPLICANT: Cocks, Benjamin G.
APPLICANT: Susan G. Stuart
APPLICANT: Osffry J. Sellhamer
TITLE OF INVENTION: COMPOSITION FOR THE DETECTION OF BLOOD CELL GENE
TITLE OF INVENTION: EXPRESSION
NUMBER OF SEQUENCES: 1508
CORRESPONDENCE ADDRESS:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          29 ------GlyGlnGluGlyGlyIle

GENERAL INFORMATION:
TITLE OF INVENTION: UNCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS
TITLE OF INVENTION: AERUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS
TITLE OF INVENTION: ABOUT SEQUENCES TRIANTION TO PSEUDOMONAS
TITLE OF INVENTION: ABOUT SEQUENCES TO PSEUDOMONAS
TITLE OF INVENTION: ABOUT SEQUENCES TO PSEUDOMONAS
TITLE OF INVENTION: ABOUT SEQUENCES TO PSEUDOMONAS
TITLE OF INVENTION NUMBER: US 60/074,788
PRIOR APPLICATION NUMBER: US 60/094,190
PRIOR FILING DATE: 1998-07-27
NUMBER OF SEQ ID NOS: 33142
SEQ ID NOS: 33142

Squence 5304, Application US/09252991A

Patent No. 6551795

GENERAL INFORMATION:

PAPLICATION:

ATTLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS

TITLE OF INVENTION: AERUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS

TITLE OF INVENTION: AERUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS

TITLE OF INVENTION: AERUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS

CURRENT FILING DATE: 1999-02-18

PRIOR FILING DATE: 1998-02-18

PRIOR FILING DATE: 1998-02-18

PRIOR FILING DATE: 1998-02-18

PRIOR FILING DATE: 1998-07-27

NUMBER OF SEQ ID NOS: 33142

SEQ ID NO 5304

LENGTH: 909

TANDER OF SEQ ID NOS: 33142

Jab_host="DT-BIN is an ormalized cDNA library containing the U1-CF-ENI is a normalized cDNA library containing the following tissue(s): Primary Lung Cystic Fibrosis Epithelial Cells. The library was constructed according to Bonaldo, Lennon and Soares, Genome Research, 6:791-866, 1996. First strand cDNA synthesis was primed with an oligo-dT primer containing a Not I site. Double stranded cDNA was ligated to an EcoR I adaptor, digested with Not I, and cloned directionally into pT713-Pac vector. The oligonucleotide used to prime the synthesis of first-strand cDNA contains a library tag sequence that is located between the Not I site and the (dT)18 tail. The sequence tag for this library is CTGCTCAGGT.

TAG_LISSUB=Human Lung Epithelial Cell Lines untreated LPS 6hr To LPS 24h.

/note="Organ: Lung; Vector: pT7T3-Pac (Pharmacia) with a modified polylinker; Site_1: ECOR I; Site_2: Not I; U1-CF-EN1 is a normalized CDNA library containing the following tissue(s): Primary Lung Cystic Fibrosis Epithelial Cells. The library was constructed according to Bonaldo, Lennon and Soares, Genome Research, 6:191-806, 1996. First strand CDNA synthesis was primed with an oligo-dT primer containing a Not I site. Double stranded CDNA was ligated to an ECOR I adaptor, digested with Not I, and cloned directionally into pT7T3-Pac vector. The oligonucleotide used to prime the synthesis of first-strand cDNA contains a library tag sequence that is located between the Not I site and the (dT)18 tail. The sequence tag for this library is CTGCTCAGGT.

with an oligo-dT primer containing a Not I site. Double stranded cDNA was ligated to an EcoR I adaptor, digested with Not I, and cloned directionally into pTT73-Pac vector. The oligonucleotide used to prime the synthesis of first-strand cDNA contains a library tag sequence that is located between the Not I site and the (dT)18 tail. The sequence tag for this library is GGCATAACC. This library was created for the program, Gene Discovery in the Visual System, supported by National Eye Institute (NEI). /note="Organ: Bone; Vector: pT7T3-Pac (Pharmacia) with amodified polylinker; Site 1: EcoR 1; Site 2: Not 1; NCI CGAP DF0 is a cDNA library containing the following tissue(s): Subchondral Bone. The library was constructed according to Bonaldo, Lennon and Soares, Genome Research, 6:791-806, 1996. First strand cDNA synthesis was primed with an oligo-df primer containing a Not I site. Double stranded cDNA was ligated to an EcoR I adaptor, digested with Not I, and clonned directionally into pT7T3-Pac vector. The oligonucleotide used to prime the synthesis of first-strand cDNA contains a library tag sequence that is located between the Not I site and the (df)18 tail. The sequence tag for this library is GTTAAGCGTC.
